

A COUPLE OF INVENTIVE FREE WHEELING IDEAS

By George White

During my recent trip to Geneseo to attend the FAC Nats, in addition to some amazing model airplanes, I stumbled across some ideas from the inventive minds of participants. One such inventive participant was **George Nason**, of Andover, MA. George had taken the ordinary plastic prop which so many of us use and created a couple of free wheel devices which appear to be far more reliable than the run-of-the-mill ramp which is built into them. As you can see from the photos, he has carefully drilled a hole through the prop next to the prop shaft and created a bail-type free wheel which is small enough to fit inside a spinner if that's what you want. The photos speak for themselves.
